

Self-organising Thucydides trap — model schematic

(A) growth, slope estimate, projection

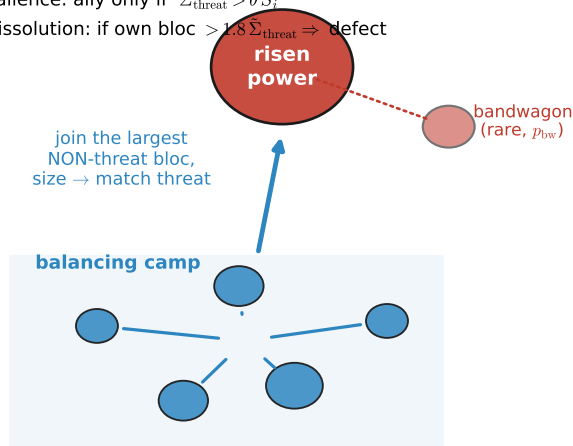

(B) predictability: accuracy-limited perception

$$\tilde{S}_j^{(i)} = \hat{S}_j(1 + \varepsilon), \quad \varepsilon \sim \mathcal{N}(0, \eta_i^2), \quad \eta_i = \sigma_p(1 - a_i)$$

(C) alliance formation by balancing

salience: ally only if $\hat{\Sigma}_{\text{threat}} > \theta \hat{S}_i$
 dissolution: if own bloc $> 1.8 \hat{\Sigma}_{\text{threat}} \Rightarrow$ defect

(D) Thucydides trigger: projected crossover
